15 **Validation of RAD-based genotyping of plastid DNA polymorphisms with the PCR-**
16 **RFLP method**

17
18 To validate RAD-based genotyping of plastid DNA polymorphims (see main paper),
19 haplotypes from six PCR-amplified plastid DNA fragments were screened for restriction
20 site polymorphisms following Lexer *et al.* (2005) and Fussi *et al.* (2010) for a subset of
21 the samples (total, 83; Italy, 48; Hungary, 35). Polymorphism data from the six fragments
22 were combined into haplotypes and compared with haplotypes previously described by
23 Fussi *et al.* (2010). A median joining network was built with the software Network
24 (Bandelt *et al.* 1999) to be able to discriminate diagnostic haplotypes for *P. alba*, *P.*
25 *tremula*, and haplotypes shared between the two species.

26 Twenty two plastid DNA haplotypes were found using PCR-RFLP, twelve of which
27 had already been described by Fussi *et al.* (2010) (**Table S1**). Except for one single
28 haplotype (H45), the median joining network allowed us to distinguish between
29 haplotypes that were restricted or almost restricted (H21) to either *P. alba* or *P. tremula*
30 (**Fig. S1**).

31 **Table S1.** Background information on individuals genotyped for the present study, including individual ID, hybrid zone
 32 locality (A, Austria; H, Hungary; I, Italy), number of raw reads and quality reads in Mio, mean coverage, percentage of
 33 missing data, admixture proportions q based on 70 microsatellites (Lindtke *et al.* 2012), q based on RAD-seq data
 34 gathered in this study, plastid haplotypes identified by PCR-RFLP (NA, not analyzed), plastid haplotypes identified by
 35 RAD-seq, and genotype class determined with RASPberry for hybrids and with ADMIXTURE for the parental species.
 36 Genotype classes Alba and Tremula correspond to the parental reference categories described in the main paper, classes
 37 Alba-like, BCA, F1, imperfect F1, Fn, BCT, and Trem-like correspond to the genotypic classes reported in Table 2 and the
 38 hybrid category in Table 1 of the main paper.

ID	Hybrid zone	Raw reads	Quality reads	Coverage	% missing data	q / micro-satellites	q / RAD	PCR-RFLP haplotype	RAD plastid haplotype	Genotype class

Hungary	<i>P. tremula</i>	0.013	0.519	0.154	0.008	0.509	0.162	0		
	<i>P. alba</i>	0.506	0.063	0.156	0.514	0.022	0.158	0.494	0	
	Hybrids	0.175	0.180	0.011	0.170	0.170	-0.001	0.143	0.151	0

42 **Table S3.** Plastid DNA haplotypes identified by RAD-seq using the *P. trichocarpa* reference plastome, including
43 SNPs named by their positions (mean coverage in brackets), and nucleotide state for each haplotype found in
44 *P. alba* and *P. tremula*.

Haplotype	SNP 81893	SNP 81901	SNP 81996	SNP 82711	SNP 82819	SNP 118145	SNP 118190
name	(3338)	(3338)	(6666)	(5404)	(2955)	(4053)	(3476)
alba1	G	T	A	G	G	A	A
alba2	G	C	A	G	G	A	A
trem1	T	T	G	T	G	G	A
trem2	T	T	G	T	G	G	C
trem3	T	T	G	T	C	G	A

45

46

47

48 **Table S4.** Linear and quadratic effects of the two genetic ancestry parameters Q12 (interspecific ancestry) and q
49 (admixture proportion) on seedling survivorship in a common garden trial of *Populus alba* and *P. tremula*, estimated using
50 mixed effect models including family membership of each seedling as a random factor. Shown are the three top-ranking
51 models based on AIC_c, the Akaike information criterion corrected for finite sample sizes. Only models with a difference in
52 AIC_c (delta AIC_c) of <7 to the best supported model are shown.
53

Intercept	Q12 linear	Q12 quad	q linear	q quad	df	Log likelihood	AIC _c	delta AIC _c	AIC _c weight
2.63	2.96		-8.23	7.69	5.00	-39.39	89.2	0.00	0.51
2.92		3.08	-5.57	5.45	5.00	-39.94	90.3	1.09	0.29
2.65	2.78	0.21	-8.08	7.56	6.00	-39.39	91.4	2.18	0.17

54
55
56 **Table S5.** Effect estimates, standard errors (SE), and probabilities (p-values) for
57 the linear and quadratic effects of Q12 and q from the top-ranking model shown in
58 Table S4, receiving >50% of the AIC weights.

	Estimate	SE	p-value
Q12 linear	2.9631	0.9689	0.002226
q linear	-8.2286	2.4644	0.000841
q quad	7.6852	2.1743	0.000408

59 **Legends to Supporting information Figures S1 – S7**

60

61 **Figure S1** Median joining network for plastid DNA haplotypes visualised by the PCR-
62 RFLP method. Haplotype names are congruent with the terminology used by Fussi *et al.*
63 (2010). New haplotypes (newly found in the PCR-RFLP validation dataset) are labeled
64 with an asterisk. Missing haplotypes are represented as black dots along lines
65 connecting haplotypes. Pie sizes are proportional to haplotype frequencies. Haplotypes
66 are colored according to their population origin: *P. alba* Italy, dark blue; *P. alba* Hungary,
67 light blue; *P. tremula* Italy, dark green; *P. tremula* Hungary, light green; *P. x canescens*
68 hybrids Italy, dark purple; *P. x canescens* hybrids Hungary, light purple.

69

70 **Figure S2** (A) Local genetic ancestry along the 19 chromosomes of hybrids in the Italian
71 hybrid zone, representing homozygous segments for *P. alba* (blue), homozygous
72 segments for *P. tremula* (orange), heterospecific ancestry segments (green) and
73 undefined segments (white). (B) Genomic admixture proportions and species origin of
74 plastid DNA for each individual (*P. alba*, blue; *P. tremula*, orange; no data, white).

75

76 **Figure S3** (A) Local genetic ancestry along the 19 chromosomes of hybrids in the
77 Hungarian hybrid zone, representing homozygous segments for *P. alba* (blue),
78 homozygous segments for *P. tremula* (orange), heterospecific ancestry segments
79 (green) and undefined segments (white). (B) Genomic admixture proportions and
80 species origin of plastid DNA for each individual (*P. alba*, blue; *P. tremula*, orange; no
81 data, white).

82

83 **Figure S4** Sizes of genomic segments (x-axis) found in backcrosses to *P. alba* (BCA,
84 blue), backcrosses to *P. tremula* (BCT, orange), a single advanced recombinant hybrid
85 (F_n , green), and ‘imperfect F_1 ’ hybrids (gray), plotted against the percentage they cover
86 on each chromosome (y-axis). Segment sizes and percentages were extracted from
87 RASPberry ancestry results.

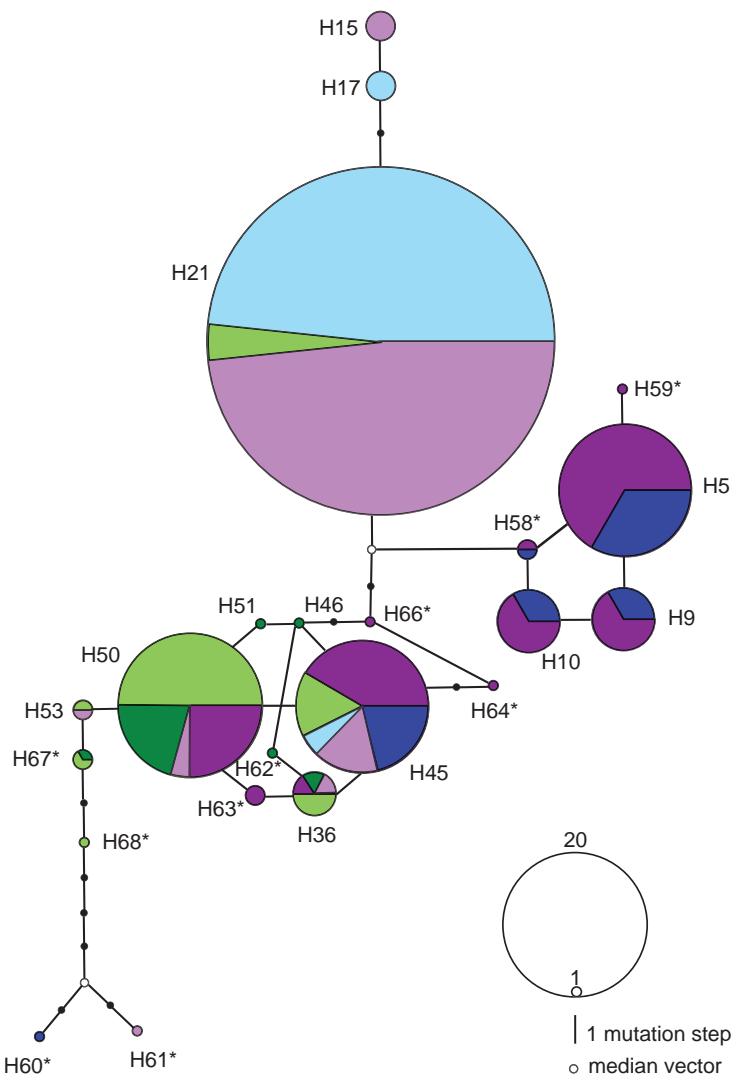

88

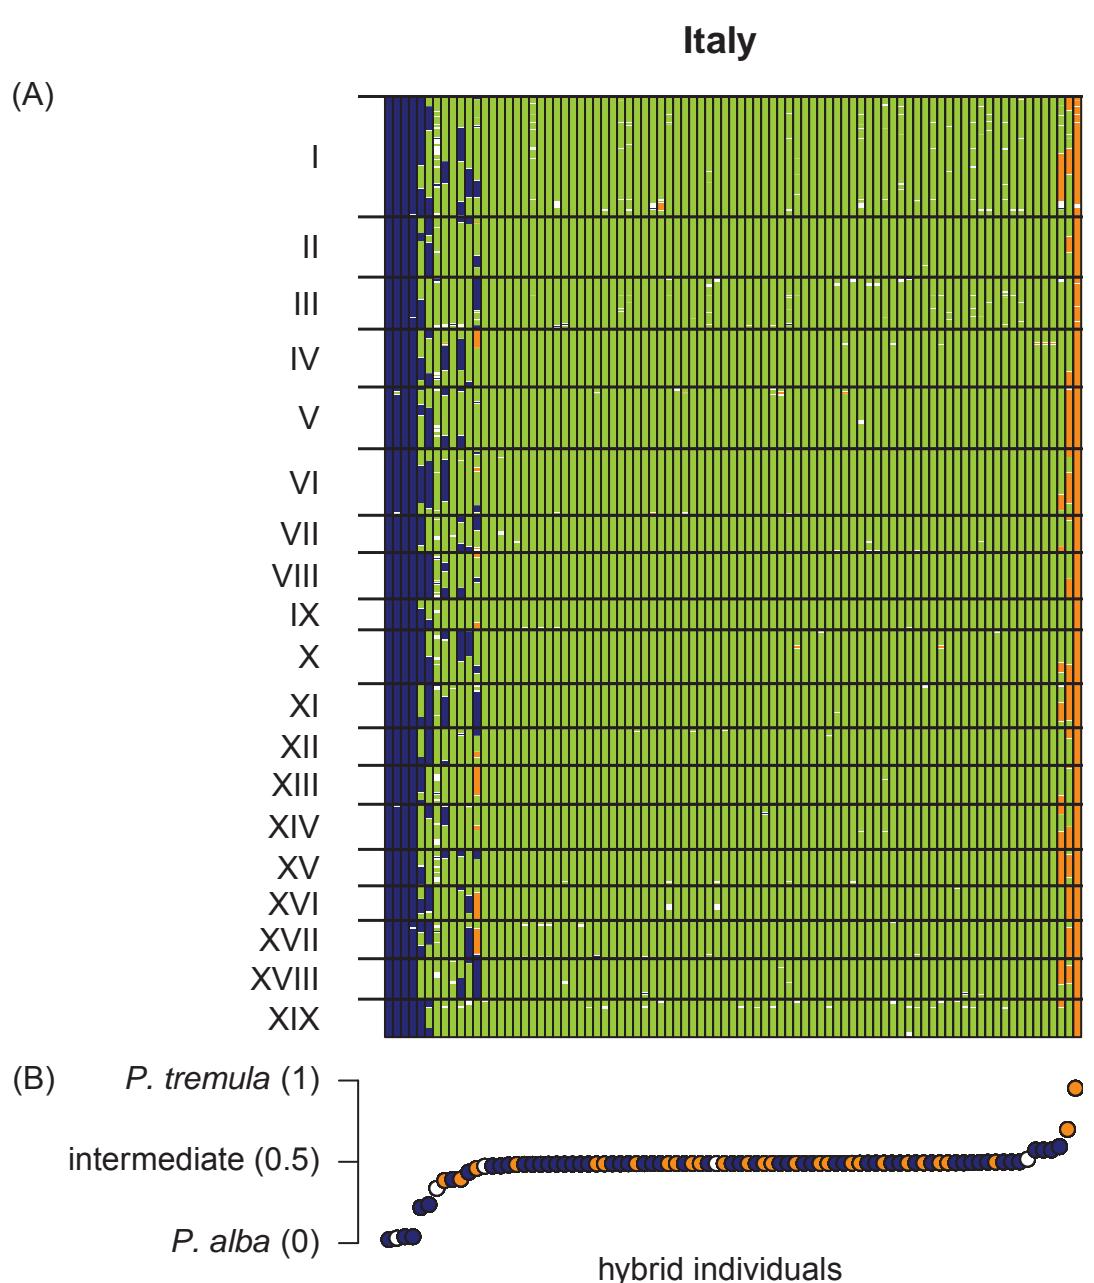

89 **Figure S5** Patterns of SNP density, interspecific genomic divergence (d_{XY}) and
90 differentiation (fixratio) between *Populus alba* and *P. tremula* for Italy (blue), Austria
91 (green) and Hungary (orange). Shown are sliding window analyses (window size, 500
92 kb; step size, 250 kb) for relative SNP density (top), D_{XY} (middle) and proportion of fixed
93 SNPs among all variable SNPs (fixratio, bottom). Results of all windowed analyses are
94 plotted against window midpoints in million bp for windows with >20 SNPs. Zero fixation
95 windows are highlighted in light yellow, thus facilitating inspection of low-differentiation
96 regions with spatially variable and spatially uniform patterns. Approximate *P. trichocarpa*
97 centromere positions are highlighted in gray.

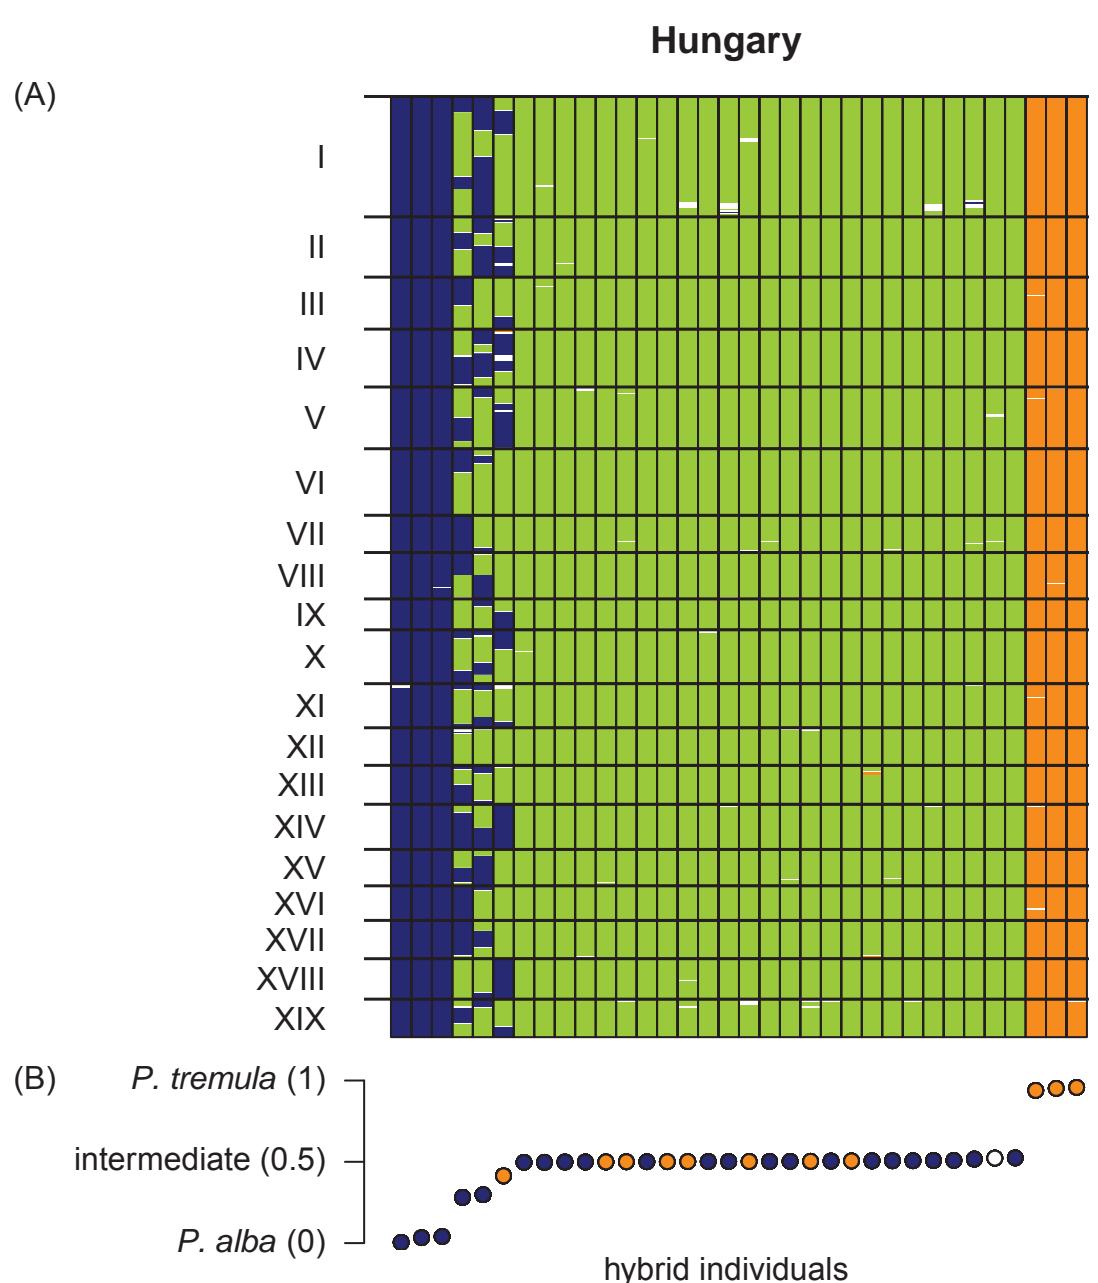

98

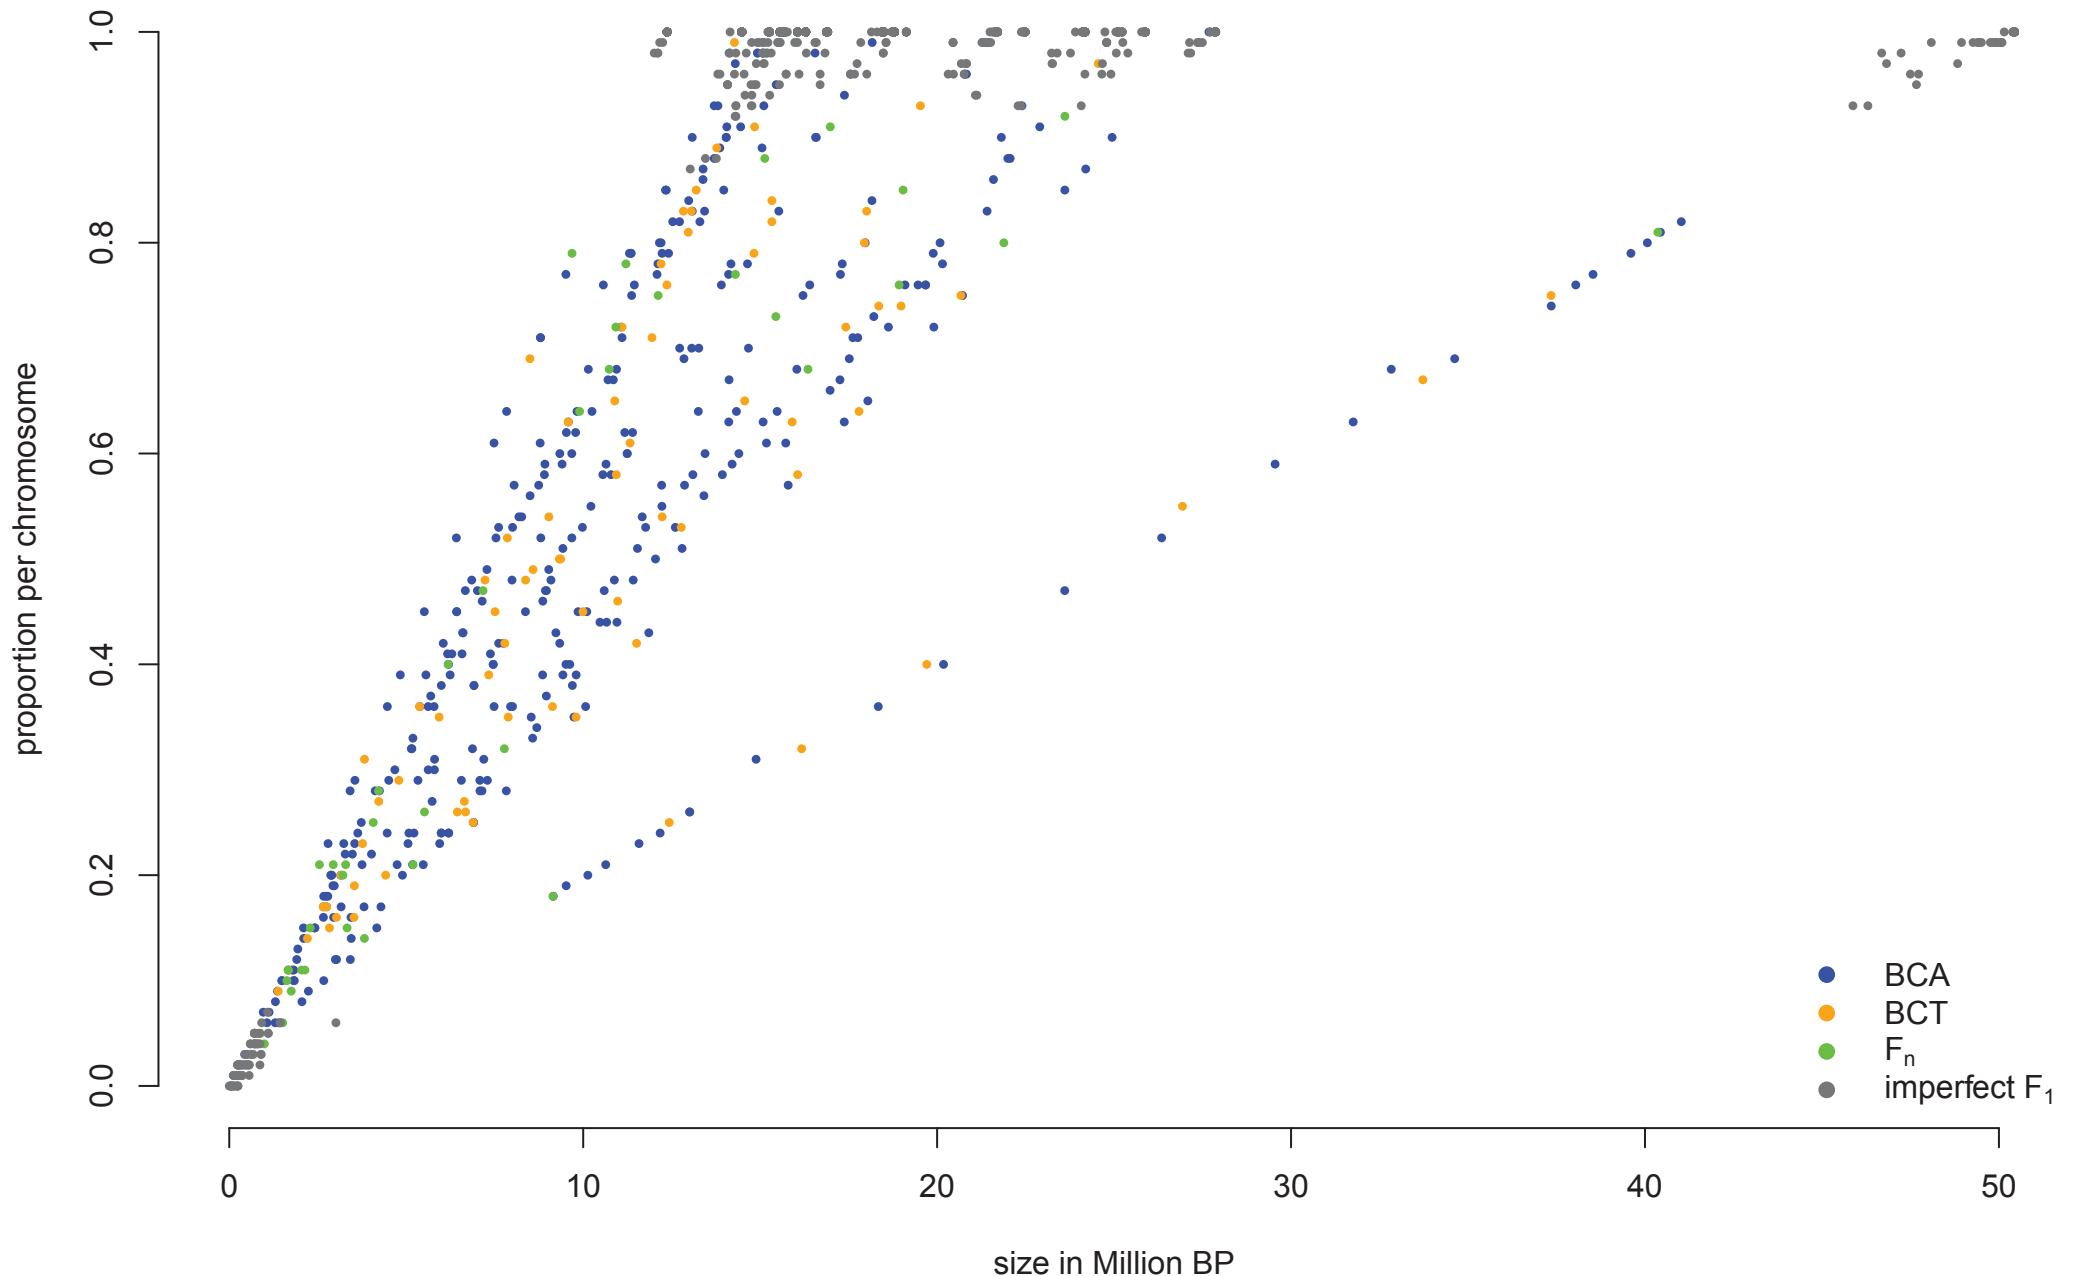

99 **Figure S6** Heat map showing linkage disequilibrium (D') from 17.5 to 21.7 million base
100 pairs (bp) of chromosome III for the parental populations of *P. alba* and *P. tremula* in the
101 Italian, Austrian, and Hungarian hybrid zone, respectively. D' is depicted on a gray scale
102 as indicated by the chart below the heat map. Positions of markers along the reference
103 genome are indicated by black bars along the diagonale. The genome region of interest
104 is framed by a bold black line.

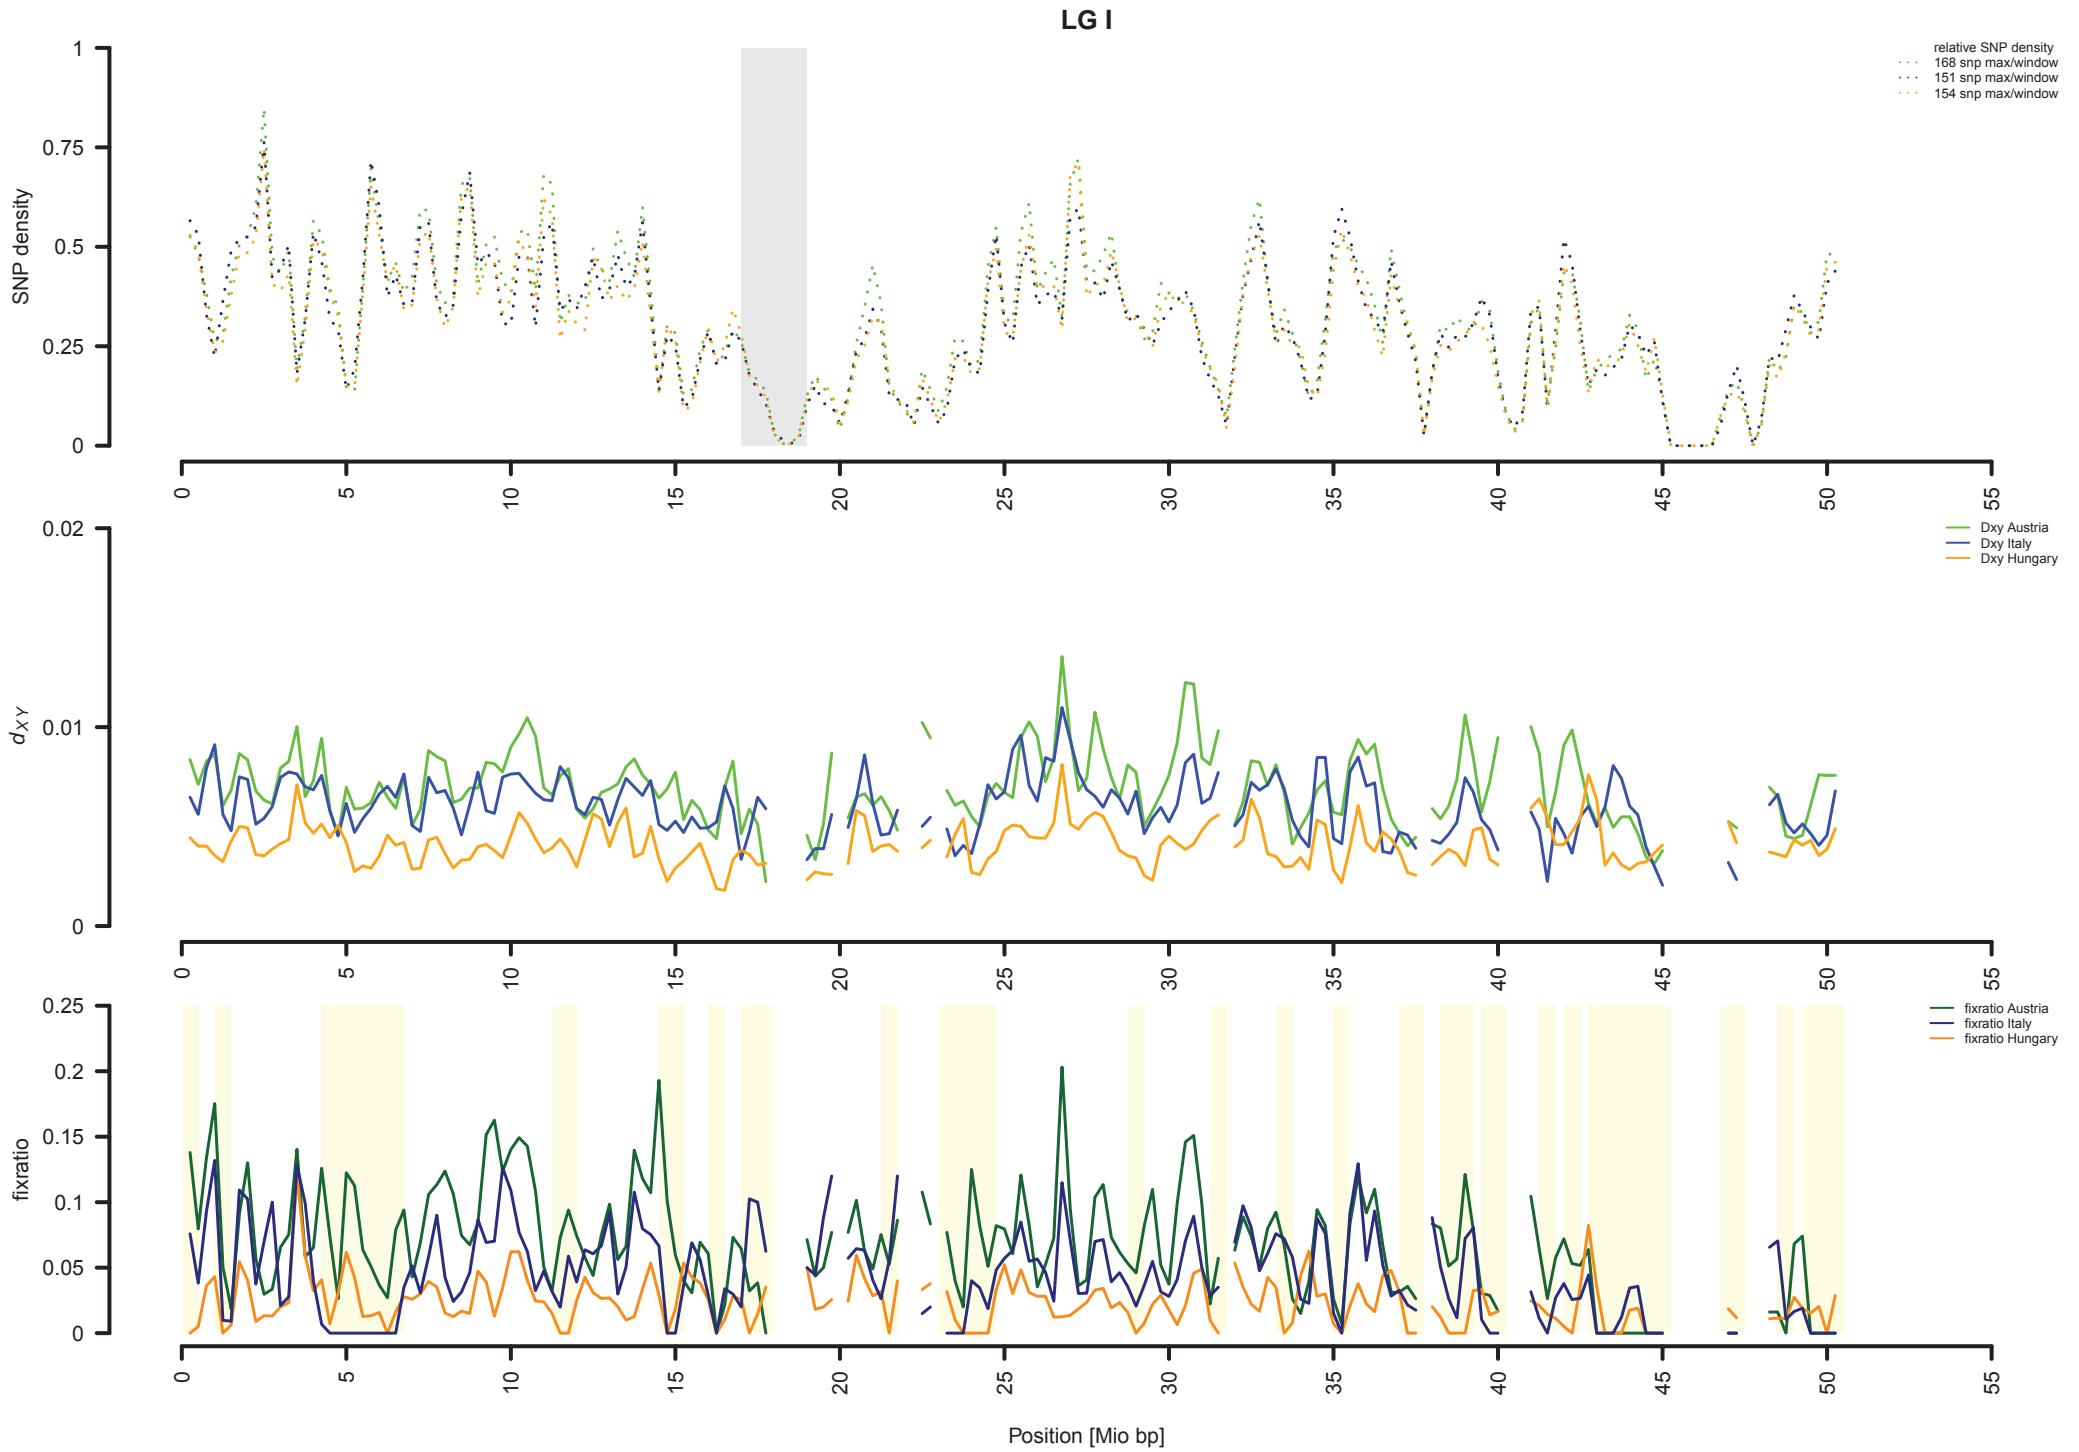

105
106 **Figure S7** Heat map showing linkage disequilibrium (D') from 2.5 to 7.5 million base
107 pairs (bp) of chromosome I for the parental populations of *P. alba* and *P. tremula* in the
108 Italian, Austrian, and Hungarian hybrid zone, respectively. D' is depicted on a gray scale
109 as indicated by the chart below the heat map. Positions of markers along the reference
110 genome are indicated by black bars along the diagonale. The genome region of interest
111 is framed by a bold black line.
112
113 **Figure S8** Graphical representation of the linear and quadratic effects of admixture
114 proportions q on seedling survivorship in a common garden trial. Reduced survivorship
115 of individuals with intermediate q (early generation hybrids) and increased survivorship
116 of individuals with large q (*P. alba*-like plants including backcrosses) are visible from the
117 plotted regression line (dashed lines are 95% confidence intervals).
118
119 **Figure S9** Graphical representation of the linear and quadratic effects of intersource
120 ancestry Q12 on seedling survivorship in a common garden trial. Reduced survivorship
121 of individuals with intermediate Q12 (recombinant early generation hybrids) and
122 increased survivorship of individuals with maximum Q12 (F_1 hybrids) is visible from the
123 plotted regression line (dashed lines are 95% confidence intervals). See Milne & Abbott
124 (2008) and Lindtke *et al.* (2012) for the expected biologically relevant parameter space
125 of Q12 and related measures of interspecific heterozygosity.
